

Thermomechanical Fluid-Structure Interaction in Supersonic Flows: Experiments and Simulation

Katharina Martin, Stefanie Reese, IFAM, RWTH Aachen University
Dennis Daub, Burkard Esser, Ali Gülhan, AS-HYP, DLR Köln

Why study thermomechanical FSI?

Ariane 5 flight 517

Buckling of nozzle cooling channels

Metallic thermal protection for reusable launchers

Buckling of supersonic aircraft surface panels

Motivation

Buckling of supersonic aircraft surface panels

Joint experimental and numerical study of fluid-structure coupled buckling problems using a generic configuration

- Turbulent SWBLI loads (D4 + D6 FP. 1/2)
- Flutter + Turbulent SWBLI (D6 FP. 3)
- Thermal buckling including plastic behavior
(D10 + D6 FP. 3)

Main effects under investigation

- Buckling with high amplitudes
- Plastic deformation
- Interaction of deformation with flow field → strong localized heating

Effect of buckling on the flow

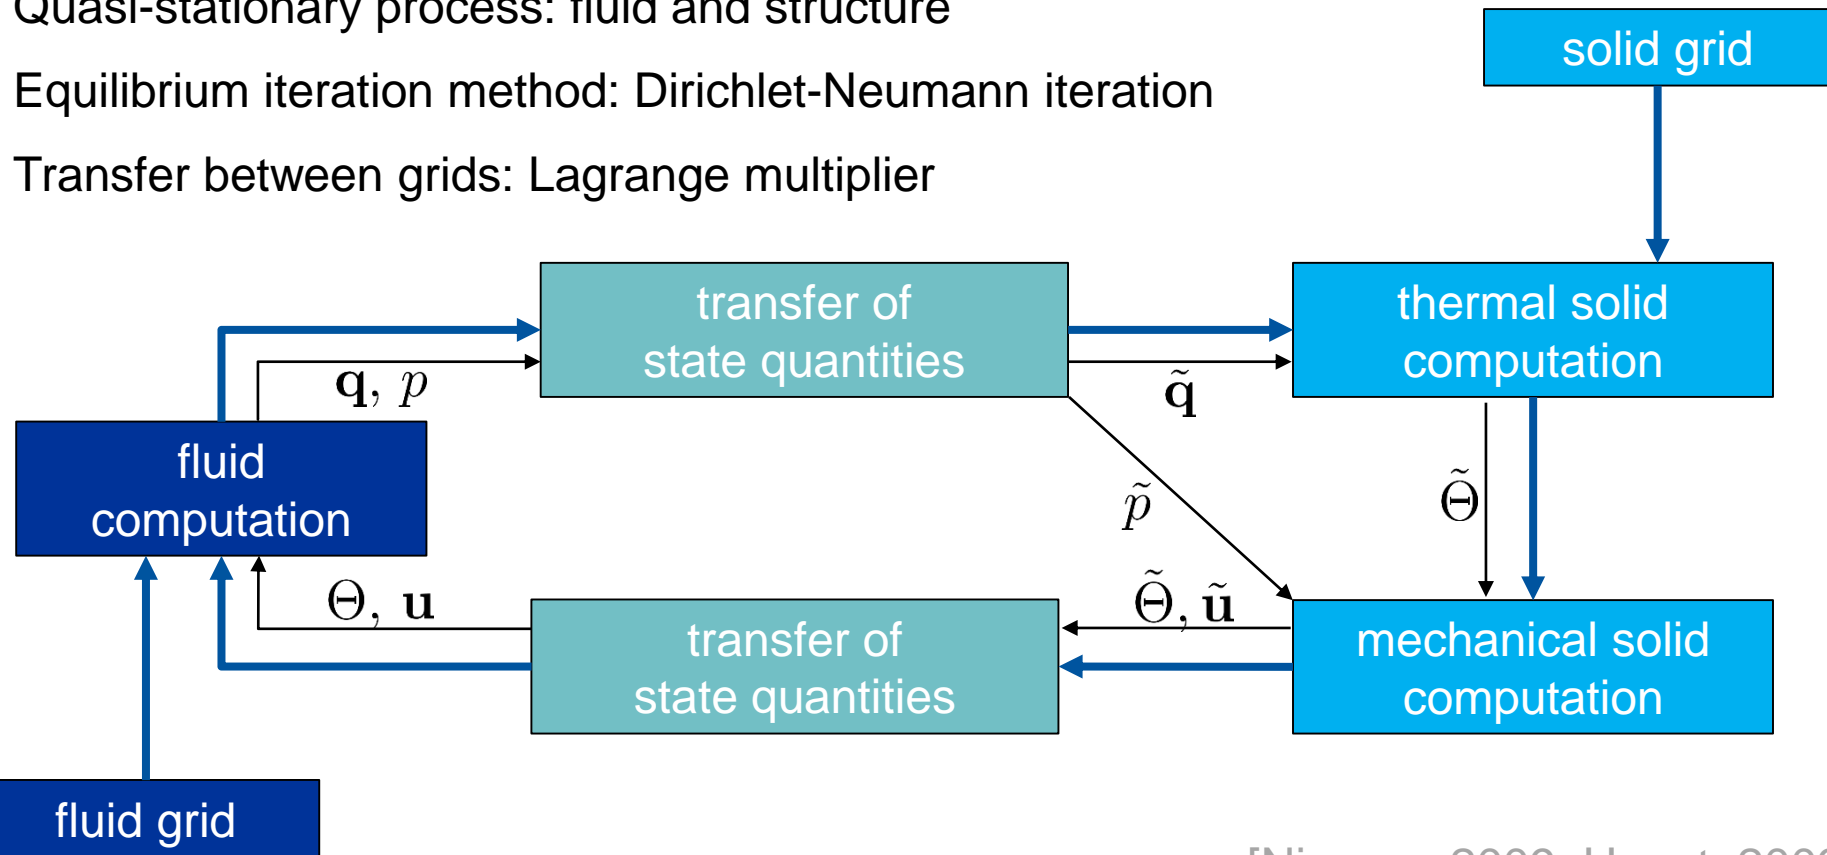

Fluid-structure interaction (FSI)

Coupling tool IFLS, TU Braunschweig

Quasi-stationary process: fluid and structure

Equilibrium iteration method: Dirichlet-Neumann iteration

Transfer between grids: Lagrange multiplier

[Niesner, 2009; Haupt, 2009]

- DLR Tau solver; laminar flow; ideal gas $\gamma = 1.451$
- Hybrid mesh, structured layers on the wall
- Mesh deforms as panel surface deforms

Material:

- panel and frame: Incoloy 800 HT
- isolation: Schupp Ultra Board 1850/500
- support plate: copper

Material model:

- mechanical: viscoplastic with nonlinear isotropic hardening + thermal expansion
- thermal: heat flux (Fourier) and radiation

Boundary Conditions (BC)

Thermal boundary condition:

- bottom: temperature $T = 300\text{K}$
- top: heat flux \mathbf{q} from fluid simulation
- cavity radiation between panel and isolation / radiation on top surface

Mechanical boundary condition:

- bottom: circular fixation
- top: pressure p from fluid simulation
- symmetrical BC at $y = 0$

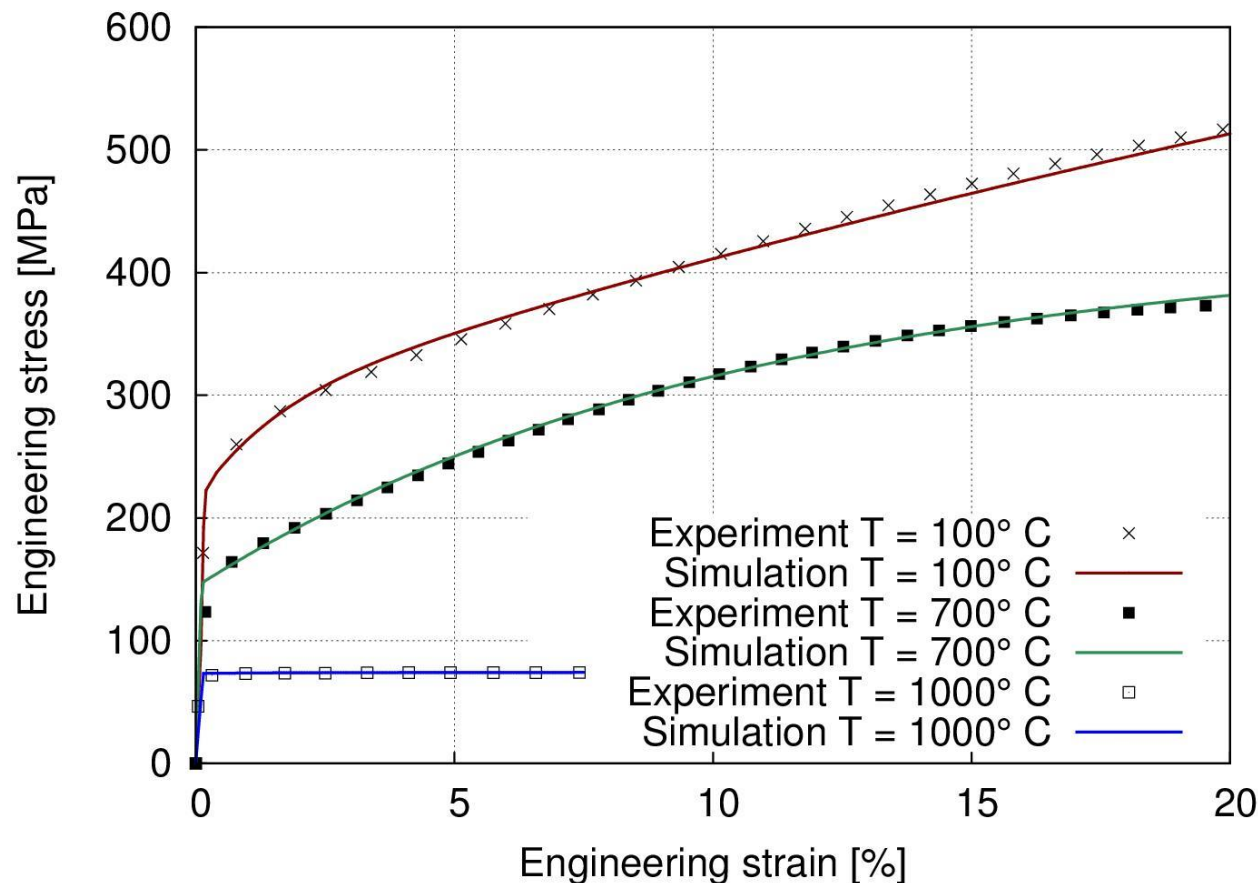

- Viscoplastic material model with
 - nonlinear isotropic hardening
 - thermal expansion
 - temperature dependent material parameters
- implemented in an Abaqus UMAT
- modified for a plane stress state in order to also use it for shell elements
- thermo-dynamically consistent
- large deformations

[Martin et al., 2019]

Material tests for Incoloy 800 HT

- Temperature range: 20°C – 1000°C
- loading rate: 0.5mm/min; 1mm/min

[Martin et al., 2018]

Arc-heated Wind Tunnel L3K

$$Ma_{\infty} = 7.7$$

$$p_{\infty} = 50.3 \text{ Pa}$$

$$T_{\infty} = 477 \text{ K}$$

$$v_{\infty} = 3756 \text{ m/s}$$

[Daub, 2020]

Wind Tunnel Run

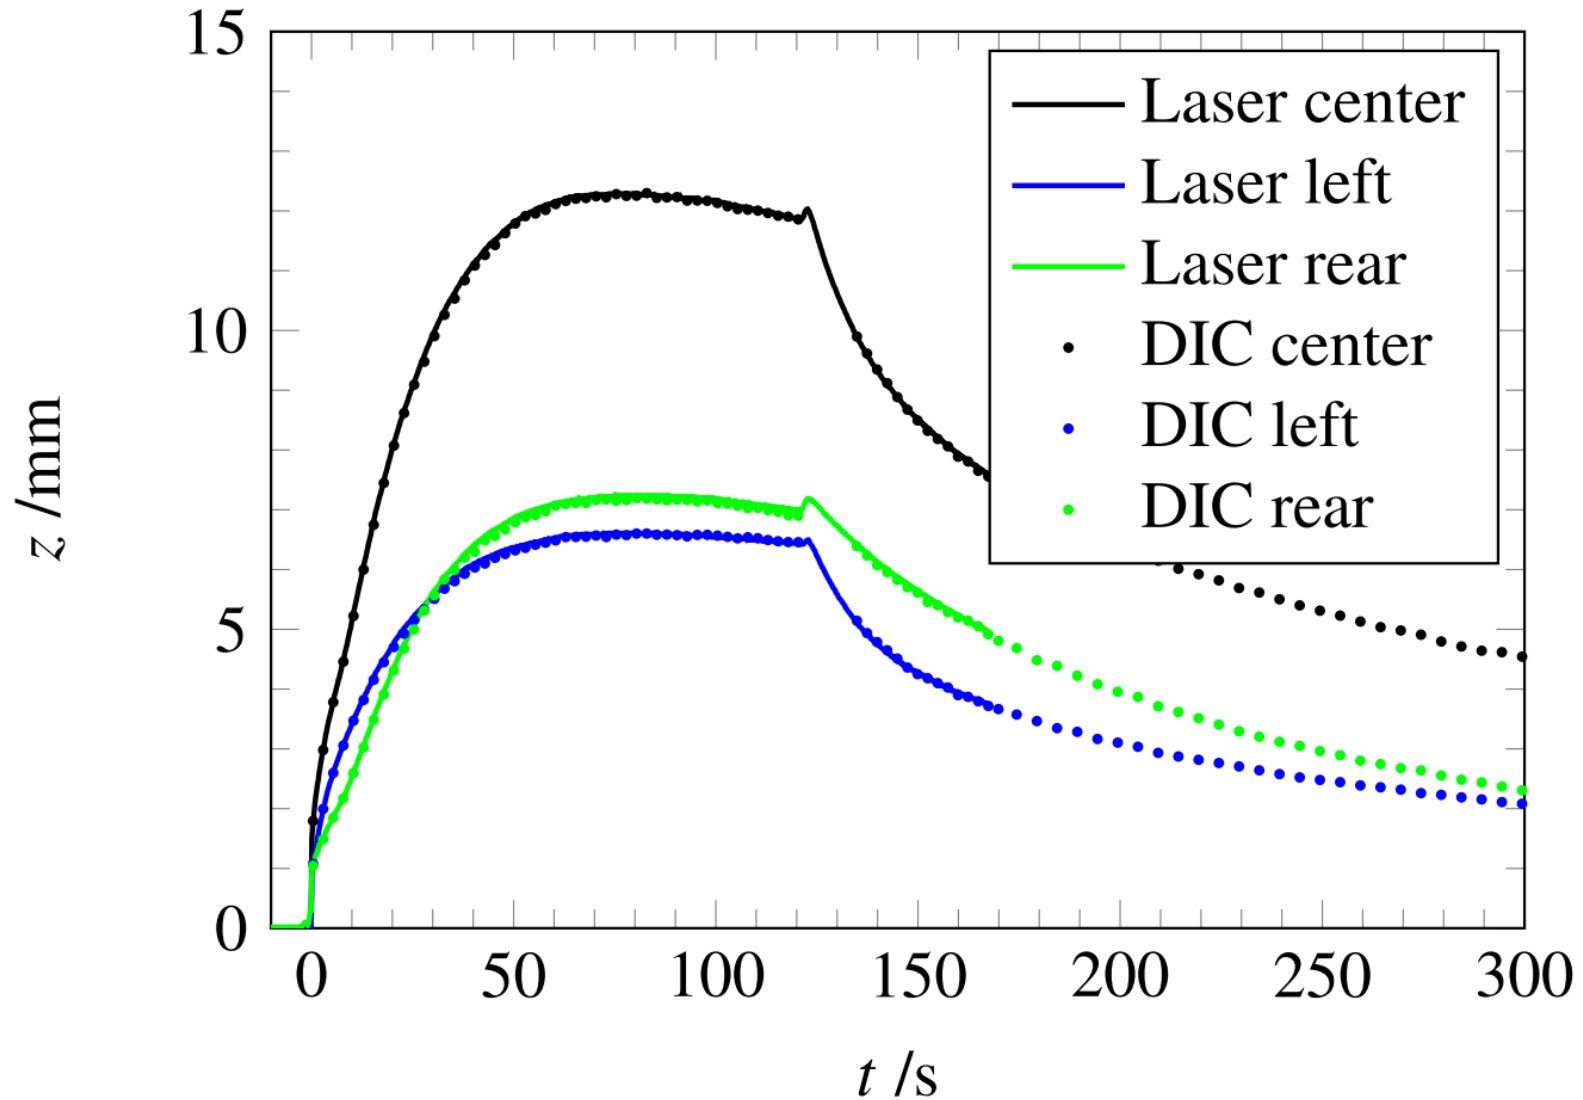

Digital Image Correlation (DIC)

Infrared Thermography (IR)

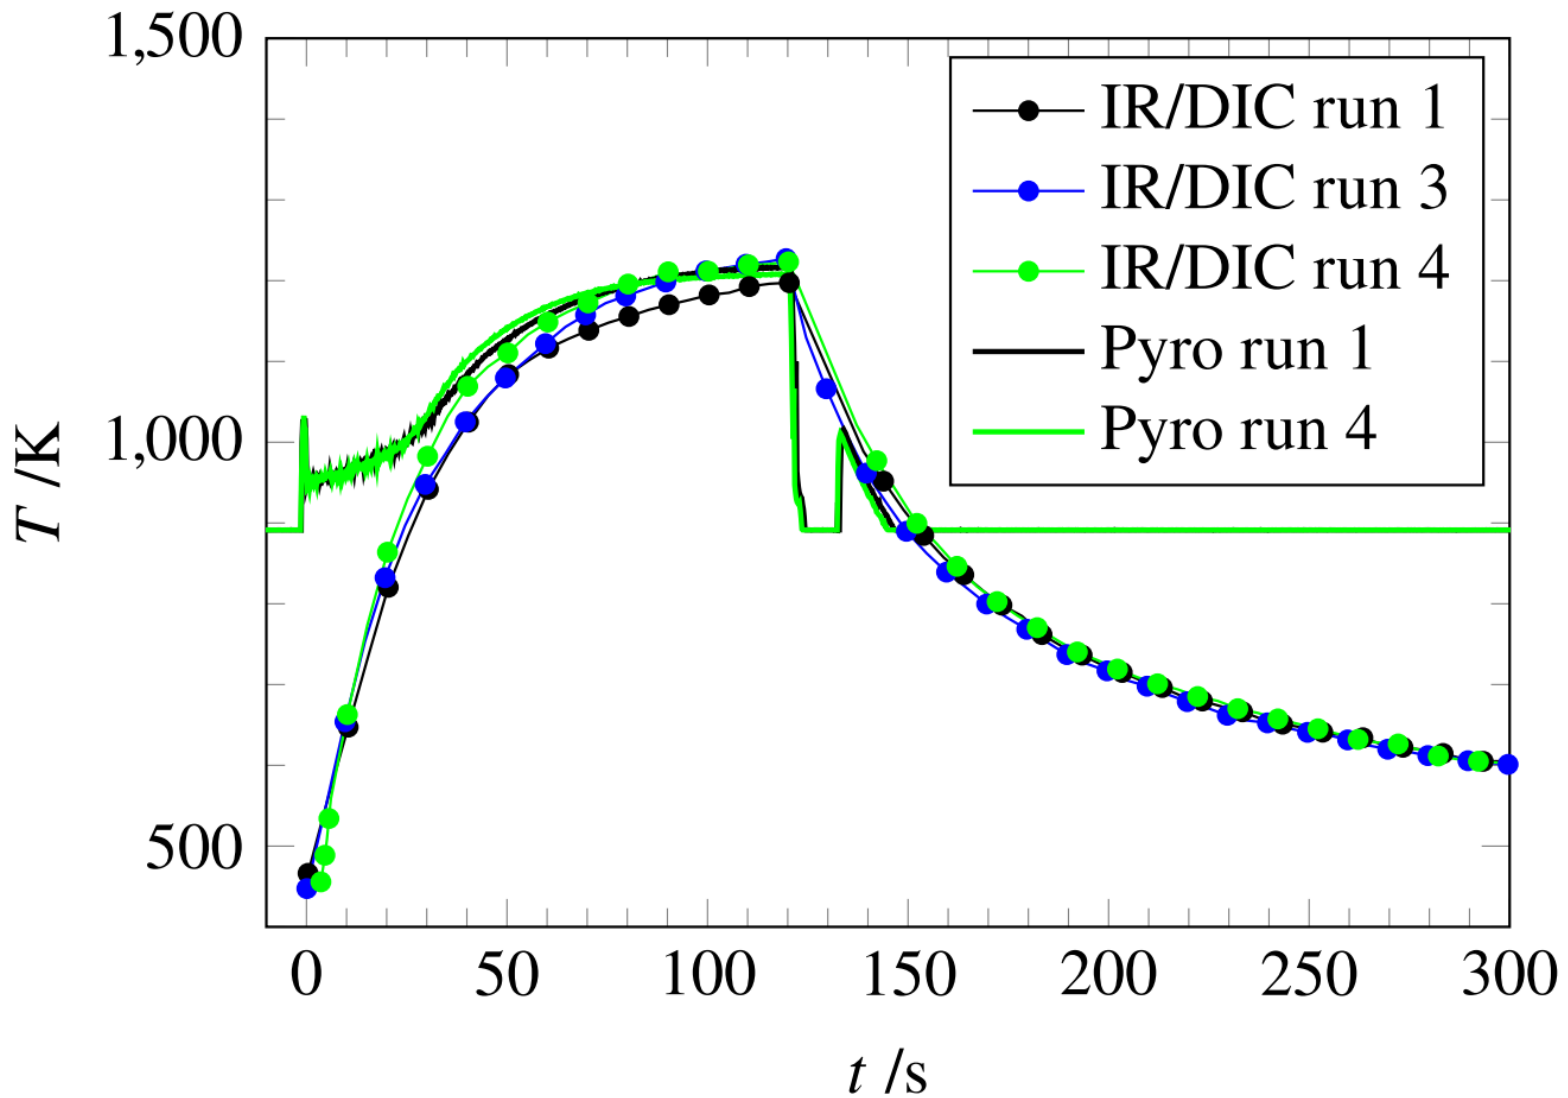

Digital Image Correlation (DIC)

Deformation

Surface Temperature

Reference Sensor Positions

Comparison of Displacement Exp/Sim

Comparison at the center of the panel

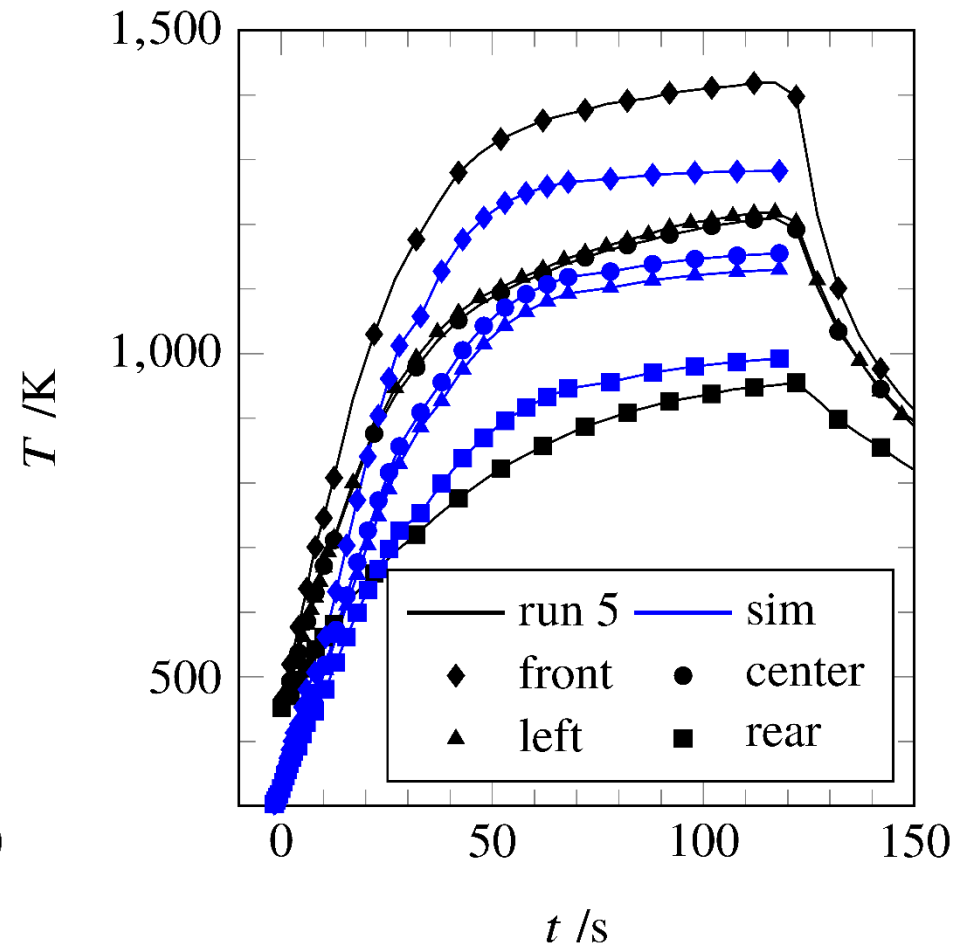

Comparison at four position of the panel

Comparison of Temperature Exp/Sim

Comparison at the center of the panel

Comparison at four positions of the panel

Comparison Exp/Sim

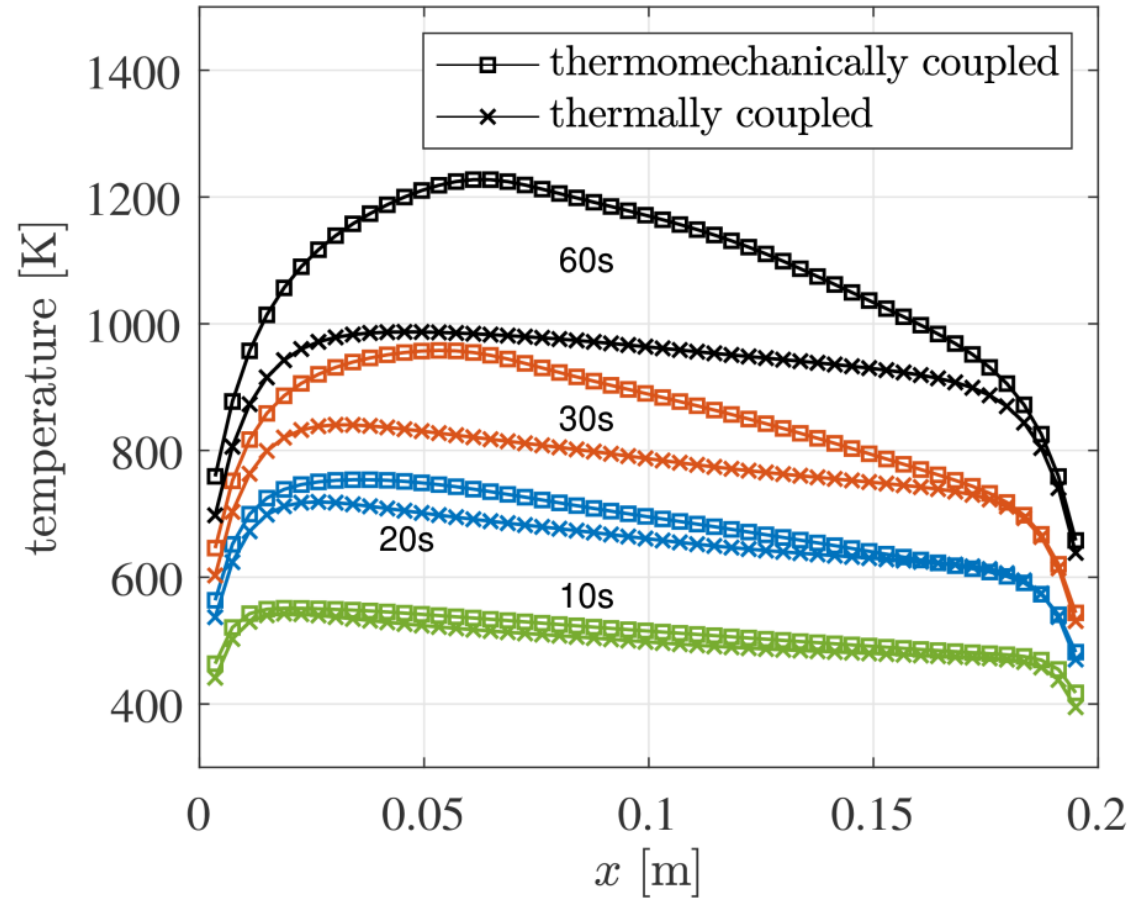

Comparison of displacement:
sim (left); exp (right)

Comparison of temperature: 27
sim (left); exp (right)

More than 200 K
difference between rigid
and buckled case

Influence of wall temperature on buckling shape

Interdisciplinary study of FSI in supersonic flow

- Fluid-Structure coupled simulations
- Modelling of plastic deformation
- Validation experiments with time-resolved full-field instrumentation

Obtained good agreement between simulation and experiments

- Strong localized (FSI driven) heating
- Significant plastic deformation

Thank you
